CONTENTS

1. Over View

GDEP073E01 is a reflective electrophoretic E Ink® SpectraTM 6 technology display module on an active matrix TFT substrate. The panel is capable of displaying black, white, yellow, red, green and blue images depending on the associated lookup table used. The circuitry on the panel includes an integrated gate and source driver, timing controller, oscillator, DC-DC boost circuit, and memory to store the frame buffer and lookup tables, and additional circuitry to control VCOM and BORDER settings.

2. Features

Highlight Red, Yellow, Green and Blue color

High contrast

High reflectance

Ultra wide viewing angle

Ultra low power consumption

Pure reflective mode

Bi-stable

Antiglare hard-coated front-surface

Low current deep sleep mode

On chip display RAM

Waveform stored in On-chip OTP

Serial peripheral interface available

On-chip oscillator

On-chip booster and regulator control for generating VCOM, Gate and source driving voltage

I2C Signal Master Interface to read external temperature sensor

Available in COG package

3. Mechanical Specifications

Note 5-1: This pin (CS#) is the chip select input connecting to the MCU. The chip is enabled for MCU communication only when CS# is pulled Low.

Note 5-2: This pin (D/C#) is Data/Command control pin connecting to theMCU. When the pin is pulled HIGH, the data will be interpreted as data. When the pin is pulled Low, the data will be interpreted as command.

Note 5-3: This pin (RES#) is reset signal input. The Reset is active Low.

Note 5-4: This pin (BUSY_N) is Busy state output pin. When Busy is low, the operation of chip should not be interrupted and any commands should not be issued to the module. The driver IC will put Busy pin low when the driver IC is working such as:

- Outputting display waveform; or
- Programming with OTP
- Communicating with digital temperature sensor

Note 5-5: This pin (BS0) is for 3-line SPI or 4-line SPI selection. When it is "Low", 4-line SPI is selected. When it is "High", 3-line SPI (9 bits SPI) is selected. Please refer to below Table.

Table: Bus interface selection

BS0	MPU Interface
L	4-lines serial peripheral interface (SPI)
H	3-lines serial peripheral interface (SPI) – 9 bits SPI

	0	1	..	..	..	..	..	..	..	..
	0	1	#	#	#	#	#	#	#	#

After this command, data entries will be written into the RAM until another command is written.

(5) Data Refresh (R12H)

Action	W/R	C/D	D7	D6	D5	D4	D3	D2	D1	D0
Data Refresh	0	0	0	0	0	1	0	0	1	0
	0	1	0	0	0	0	0	0	0	1

When this command is received. IC will start the refresh process. BUSY_N will become “0”. After the refresh process is finished, BUSY_N will become “1”.

7. Electrical Characteristics

7.1 Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Analog power	VDD	-0.5 to +3.6	V
Operating Temp. range	TOPR	(0 to +50)	℃
Storage Temp. range	TSTG	(-25 to +60)	℃

Note: Maximum ratings are those values beyond which damages to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics chapter.

7.2 Display Module DC characteristics

The following specifications apply for: VDD = 3.0V, VDD_1.8 = 1.8V, TA = 25℃

Digital DC Characteristics						
Symbol	**Parameter**	**Conditions**	**MIN.**	**TYP.**	**MAX.**	**Unit**

P_{STBY}	Standby Power Dissipation	VDD=3.0V	--		--	uW
I_{MDS}	Module deep sleep current	Deep sleep mode	-		-	uA

Note:

- The Inrush Current means the inrush current occurs during dual booster on sequence, and it is measured by using Oscilloscope, and extract the Max value

- The Driving Peak Current means the peak current occurs during image update after dual booster on sequence, and it is measured by using Oscilloscope, and extract the Max value.

- The Module Operating Current data is measured by using Oscilloscope, and extract the Mean value.

-The typical loading power consumption is measured using associated 25℃ waveform with following pattern transition: from full white pattern to color pattern.

-The high loading power consumption is measured using associated 25℃ waveform with following pattern transition: from full white pattern to noise pattern (including random scattering of 6 colors)

- The minimum VDD value by 2.5V is based on typical application pattern with stable and continuing power supply. It does not apply on high loading pattern.
- The listed electrical/optical characteristics are only guaranteed under the controller & waveform provided by Good Display.
- Vcom value has been set in the IC on the panel.

7.3 Panel AC Characteristics

7.3.1 MCU Interface

7.3.1.1 MCU Interface Selection

In this module, there are 4-wire SPI and 3-wire SPI that can communicate with MCU. TheMCU interface mode can be set by hardware selection on BS0 pins. When it is "High", 4-wire SPI is selected. When it is "Low", 3-wire SPI (9 bits SPI) is selected.

Pin Name	Data/Command Interface		Control Signal		
Bus interface	SDA	SCL	CS#	D/C#	RES#

Note 7-1: Lis connected to GND
Note 7-2: H is connected to VDD

7.3.1.2 MCU Serial Interface (4-wire SPI)

The 4-wire SPI consists of serial clock SCLK, serial data SDA, D/C#, CS#.

Function	CS#	D/C#	SCLK
Write Command	L	L	↑
Write data	L	H	↑

Table 7-2: Control pins of 4-wire Serial Peripheral interface

Note 7-3: ↑ stands for rising edge of signal

SDA is shifted into an -bit shift register in the order of D7, D6, ... D0. The data byte in the shift register is written to the Graphic Display Data RAM (RAM) or command register in the same clock. Under serial mode, only write operations are allowed.

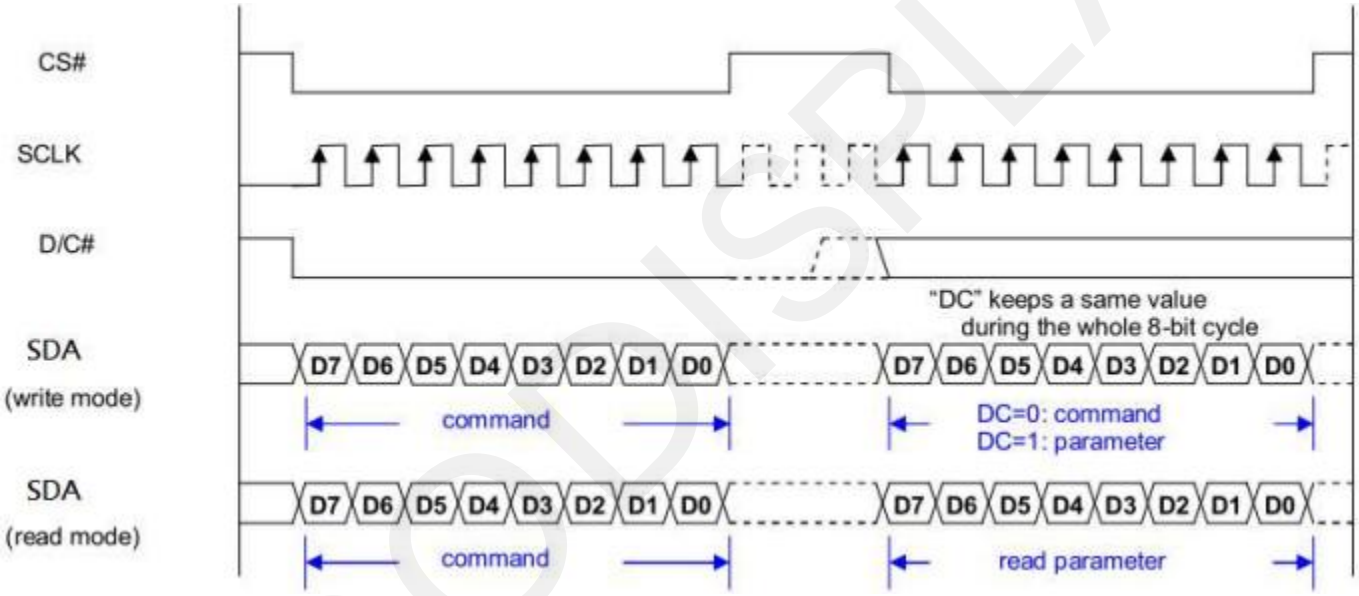

Figure 7-1: Write procedure in 4-wire Serial Peripheral Interface mode

7.3.1.3 MCU Serial Interface (3-wire SPI)

The 3-wire serial interface consists of serial clock SCLK, serial data SDA and CS#.

In 3-wire SPI mode, the pin D/C# can be connected to an external ground.

The operation is similar to 4-wire serial interface while D/C# pin is not used. There are altogether 9-bits will be shifted into the shift register on every ninth clock in sequence: D/C# bit, D7 to D0 bit. The D/C# bit (first bit of the sequential data) will determine the following data byte in shift register is written to the Display Data RAM (D/C# bit = 1) or the command register (D/C# bit = 0).Under serial mode, only write operations are allowed.

Function	CS#	D/C#	SCLK
Write Command	L	Tie LOW	↑
Write data	L	Tie LOW	↑

8. Optical Characteristics

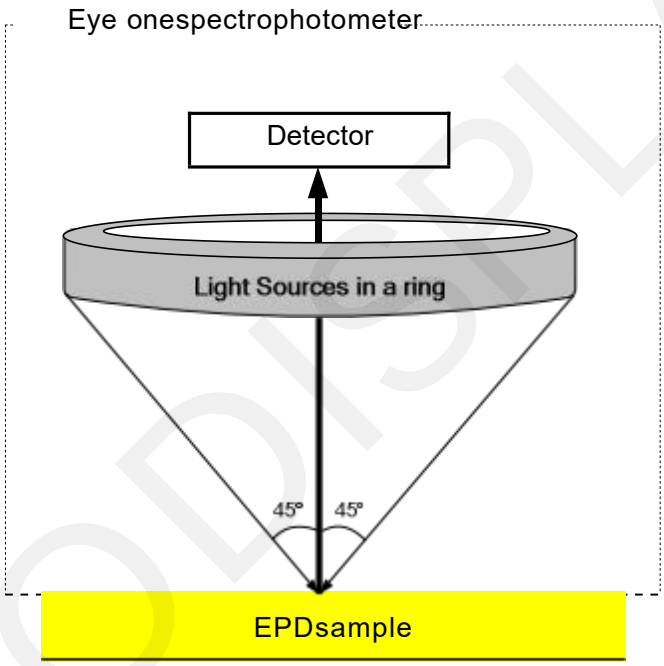
8.1 Specification

Measurements are made with that the illumination is under an angle of 45 degrees, the detector is perpendicular unless otherwise specified.

8.2 Definition of contrast ratio

The contrast ratio (CR) is the ratio between the reflectance in a full white area (Rl) and the reflectance in x

$$CR = Rl/Rd$$



8.3 Reflection Ratio

The reflection ratio is expressed as :

R = Reflectance Factorwhiteboard x (L_{center} / $L_{whiteboard}$)

L_{center} is the luminance measured at center in a white area (R=G=B=1).

$L_{whiteboard}$ is the luminance of a standard whiteboard.

Both are measured with equivalent illumination source. The viewing angle shall be no more than 2 degrees.

9. Handling, Safety and Environmental Requirements

WARNING
The display glass may break when it is dropped or bumped on a hard surface. Handle with care. Should the display break, do not touch the electrophoretic material. In case of contact with electrophoretic material, wash with water and soap.

CAUTION
The display module should not be exposed to harmful gases, such as acid and alkali gases, which corrode electronic components.
Disassembling the display module can cause permanent damage and invalidate the warranty agreements.

Observe general precautions that are common to handling delicate electronic components. The glass can break and front surfaces can easily be damaged. Moreover the display is sensitive to static electricity and other rough environmental conditions.

Data sheet status	
Product specification	The data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and dose not form part of the specification.

11. Matched Development Kit

Our Development Kit designed for SPI E-paper Display aims to help users to learn how to use E-paper Display more easily. It can refresh black-white E-paper Display, three-color (black, white and red/Yellow) E-paper Display and four-color(black, white, red and yellow) Good Display ‘s E-paper Display. And it is also added the functions of USB serial port, FLASH c hip, font chip, current detection ect.
Development Kit consists of the development board and the pinboard. Supported development platforms include STM32 and ESP32. More details, please click to the following links:

STM32	https://www.good-display.com/product/219.html
ESP32	https://www.good-display.com/product/338.html

12. Precautions

(1) Do not apply pressure to the EPD panel in order to prevent damaging it.

(2) Do not connect or disconnect the interface connector while the EPD panel is in operation.

(3) Do not touch IC bonding area. It may scratch TFT lead or damage IC function.

(4) Please be mindful of moisture to avoid its penetration into the EPD panel, which may cause damage during operation.

(5) If the EPD Panel / Module is not refreshed every 24 hours, a phenomena known as "Ghosting" or "Image Sticking" may occur. It is recommended to refreshed the ESL /EPD Tag every 24 hours in use case. It is recommended that customer ships or stores the ESL / EPD Tag with a completely white image to avoid this issue

(6) High temperature, high humidity, sunlight or fluorescent light may degrade the EPD panel's performance. Please do not expose the unprotected EPD panel to high temperature, high humidity, sunlight, or fluorescent for long periods of time.
